Assumptions we made:

1. Assuming that a person has a phone number type that falls under one of 4 categories: personal, home, work, and other.

2. Assuming that service personnel can be one of 4 levels (technician, senior technician, supervisor, manager) and cannot belong to more than one level.

3. Works on table records the total cost of the repairs for that entire day. For example if a worker works on different parts of the same ship on the same day, the sum of the costs of both fixes will be recorded, and both fixes will be considered one entry as they happened on the same day by the same worker.

4. Age of passenger is calculated from Date of birth from persons attribute

5. Assuming that adults cannot be passengers of the transit, since passengers have the type child, senior, and student.
